

Lay Low When Energy Use Rises

Desert dwellers like javelinas, coyotes and rabbits know it's best to lay low and conserve energy during the hottest period of the day.

UniSource customers would do well to follow their lead. By avoiding energy use between 3-7 p.m. during the summer, you can help keep our service reliable and affordable – and maybe even save some money yourself.

Energy supplies will be tight this summer as hotter temperatures increase demands on the western grid. While UniSource is well-prepared for the

summer, regional shortages could increase energy costs and limit access to backup power if generators fail or wildfires force transmission line shutdowns.

Conserving energy during on-peak hours helps ease the pressure on our grid. It also can save you money if you're using one of our Time of Use pricing plans. By shifting energy use to off-peak hours, you can enjoy lower energy costs while supporting reliable, affordable energy service for everyone.
